

# Advanced uses of SPI at Mustang

# Mustang's use of external tools in conjunction with SPI

Today we will discuss tools to perform the following functions:

- Export data to consumers
- Mine data from current and past jobs simultaneously
- Audit projects to improve quality and consistency

# Exporting data to consumers

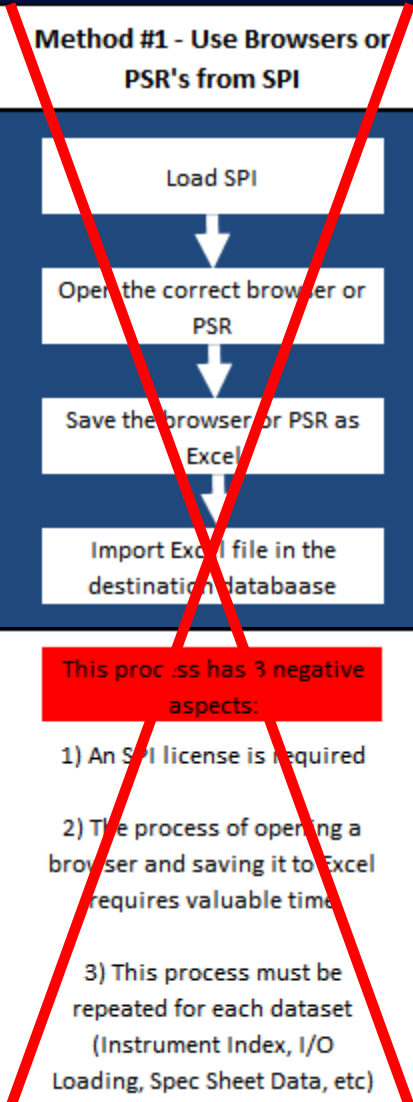

Most projects have at least 2 non-Instrument project groups that need SPI data to complete their tasks.

It is important to our success to be able to empower these groups with the ability to get SPI data themselves.

# Exporting data to consumers

Method #1 - Use Browsers or PSR's from SPI	Method #2 - On-demand export from external tool	Method #3 - Nightly scheduled export from external tool
 <pre> graph TD     A[Load SPI] --&gt; B[Open the correct browser or PSR]     B --&gt; C[Save the browser or PSR as Excel]     C --&gt; D[Import Excel file in the destination database]           </pre>	<pre> graph TD     A[Load Mustang SPI Dashboard] --&gt; B[Export data from SPI to the destination database]           </pre>	<pre> graph TD     A[Scheduled nightly export to the destination database]           </pre>
<p>This process has 3 negative aspects:</p> <ol style="list-style-type: none"> <li>1) An SPI license is required</li> <li>2) The process of opening a browser and saving it to Excel requires valuable time</li> <li>3) This process must be repeated for each dataset (Instrument Index, I/O Loading, Spec Sheet Data, etc)</li> </ol>	<p><b>Positives:</b></p> <ol style="list-style-type: none"> <li>1) No SPI License needed</li> <li>2) Quick and easy access to SPI data</li> <li>3) The user can request data whenever it is needed</li> <li>4) The export process can include multiple datasets</li> </ol>	<p><b>Positives:</b></p> <ol style="list-style-type: none"> <li>1) No SPI License needed</li> <li>2) The data is updated each morning without any effort from the user</li> <li>3) The export process can include multiple datasets</li> </ol>

# Exporting data to consumers – Example

---

**Date: Friday, November 4<sup>th</sup>**

**Project details: Multiple projects from the same client being managed by a common automation team.**

**Task: Automation engineer to export Instrument Index data and I/O Loading data from 3 projects. Data is to be placed in 3 separate msAccess files.**

**Start time: 2:40:28 PM**

**Completion time: 2:42:00 PM**

**Duration of task: 1 min 32 seconds**

# Exporting data to consumers – Protecting database connection info

---

How do we provide data without giving out server and database connection information?

- For methods #2 and #3, as discussed previously, Mustang uses published .Net applications.
- These published applications give the user the functionality they need by simply picking their project and requesting updated data. No database connection information or login credentials are needed.

# Exporting data to consumers – Others Concerns

---

**By allowing easy access to SPI data on-demand, there is the danger of incomplete data being used by other disciplines.**

- **Consumers must understand that data extracted directly from SPI is often not 100% ready for use throughout the project.**
- **Strong communication must be kept with the instrumentation project team to make sure that all parties understand the difference between published data and directly extracted data.**

# Exporting data to consumers – Setup

---

**In order to provide easy access to SPI data, an admin must meet with the consumer and discuss the desired dataset to be exported.**

- **This setup time is minimal and saves a large amount of time over the life of the project.**
- **The process keeps the admin team informed of the special needs of the project.**

# Exporting data to consumers - Summary

---

**At Mustang we strive to make heroes of each part of our project team.**

**When it comes to SPI data, one way we can make heroes is by increasing the availability of the data and allowing other people to excel.**

# **SPI Data Mining – Using current and past projects**

---

**Each project that uses SPI has such a large bank of information that can be used during project execution, during commissioning and startup, and later as we prepare for future projects.**

**Because Intergraph has allowed the underlying database to remain open, we can tap into this bank of information and improve the way we work.**

# **SPI Data Mining – Multi-project data gathering**

---

**The ability to gather data from multiple projects can be extremely valuable for many reasons, including:**

- Forecasting**
- Progressing**
- Auditing**
- Comparing**

# SPI Data Mining – Multi-project statistics

- 15 projects from 3 different SPI

# SPI Data Mining – Installation Detail Example

- Instrument design lead needed to track the progress of installation details (hookups) for multiple projects.
- Old-fashioned method was to open a project in SPI, open the appropriate hookup browser, get a record count, record this count, and repeat this process for each type of hookup and for each project.
- New method, calculate using the Mustang SPI Dashboard

# SPI Data Mining – Installation Detail Example

- Estimated old-fashioned method – 5 minutes per project
- In the example shown to the right, this task would take **75 minutes**
- Using Mustang SPI Dashboard, total time **< 2 minutes**.

# SPI Data Mining – Quality Control

---

One of the most important things that we do with our Mustang SPI Dashboard is to perform quality control checks. A great example of these are tag / entity name mismatches.

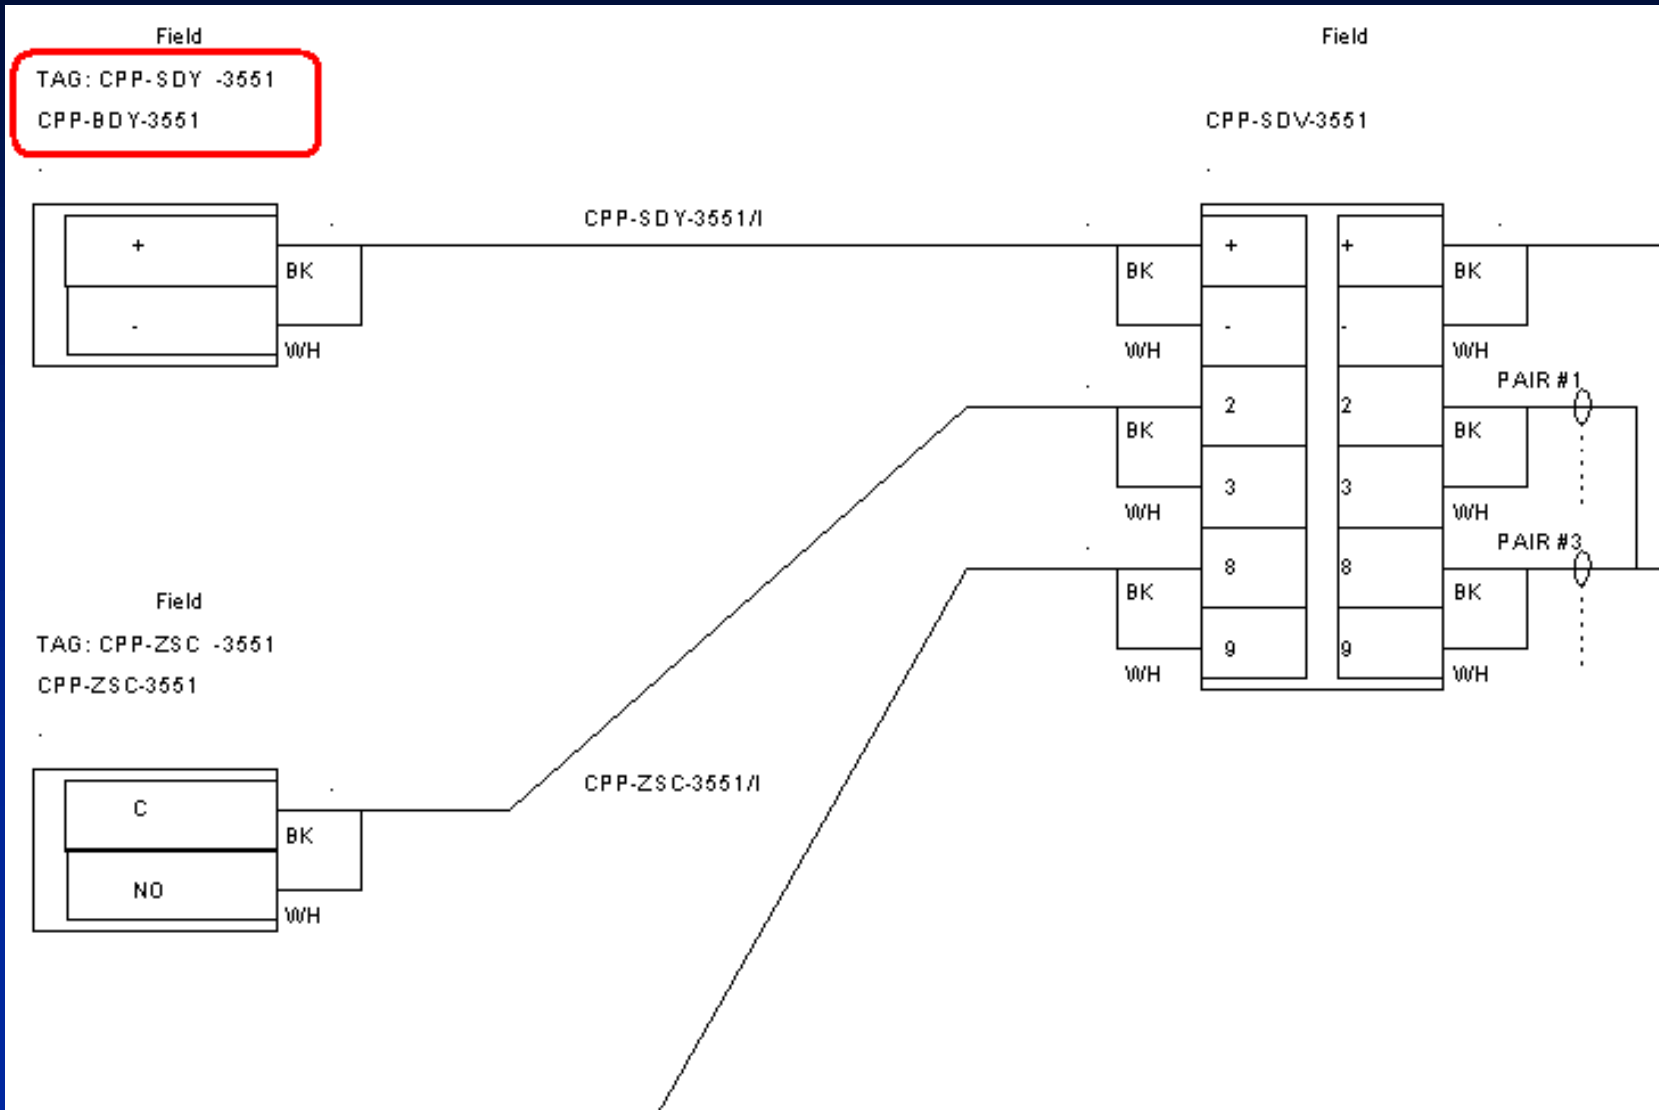

- Tag
- Loop
- Device Panel
- Device Cable
- Fieldbus Virtual Tag
- CS Tagname
- Specification Sheet
- Process Data Sheet

# Mismatch between Tag and Device Cable

# Mismatch between Tag and Device Panel

# Mismatch between Tag and Control System Tag

# Mismatch between Tag and Spec Sheet / Process Data Sheet

The screenshot shows a 'Domain Explorer' window with a tree view of process tags. The tree is organized into several levels. A red rectangular box highlights the tag 'CPP-PT -2109' and its two sub-items, 'CPP-PT-2102--SP' and 'CPP-PT-2102--PD'. A green rectangular box highlights the tag 'CPP-PT -2110' and its two sub-items, 'CPP-PT-2110--SP' and 'CPP-PT-2110--PD'. Other visible tags include 'CPP-P -2106', 'CPP-P -2108', 'CPP-P -2109', 'CPP-PALL -2109', 'CPP-PI -2109', 'Field\_RIO break', 'AI\_01', 'TYP. LOOP NOTE', 'CPP-P-2109', 'CPP-P -2110', 'CPP-PI -2110', and 'CPP-P -2111'. The window title bar reads 'Domain Explorer' and the address bar also shows 'Domain Explorer'.

# SPI Data Mining – Summary

---

- **Quick, read-only access to SPI data**
- **Progressing and auditing capabilities**
- **Specific functions to meet the needs of each project**

# Where are we headed?

---

- **Continued excellence with SPI**
- **Continued integration with SmartPlant P&ID**
- **Continued integration with SmartPlant Electrical**

# Questions

---

**Any questions or ideas?**
